

Shipping 1.1: from “add Punjabi” to the review queue

Every stop on the line that took BusPulse Vancouver from its live 1.0 to version 1.1 — a Punjabi localization, an honest coverage message, a listing fix, and one rebuilt binary now waiting on Apple.

● **1.1.0 · Build 24 — Waiting for Review** · Auto-release on approval · submitted 2026-08-26

THE ROUTE

Five phases, twenty stops

Read it top to bottom like a transit line. Green rings are validation gates that had to pass; the red × is where build 23 expired and we rerouted; the red beacon marks the terminus of the journey — the moment 1.1 entered Apple’s review queue — with the closeout tidy-up below it.

01 Punjabi localization

the feature

Scope the i18n architecture

A master English dictionary, a typed Punjabi mirror, a reactive `useT()` hook plus a plain `t()` for non-React code, and a Settings language picker.

locales/en.ts

locales/pa.ts

locales/i18n.ts

Translate everything to Gurmukhi

All 165 user-facing strings — tabs, screens, a11y labels, notifications, share text. Brand names and GTFS stop names stay English on purpose.

ਪੰਜਾਬੀ

165 keys

Wire device detection + iOS locale

Language preference is `system · en · pa`; the binary declares both locales so iOS lists Punjabi and can auto-pick it.

CFBundleLocalizations

expo-localization

Catch two hard-coded English leaks

A grep found “Loading arrivals” and “Service Alert” bypassing the dictionary — both rerouted through translation keys.

Skeleton.tsx

gtfsRealtime.ts

Validation gate

Type check clean · key parity 165/165 · every `{param}` placeholder matches · native-speaker sense-check of grammar and gender agreement.

tsc clean

v1.1.0

02 The Ucluelet coverage report

a diagnostic detour

Bug report: “no buses on the Island”

A user in Ucluelet, on Vancouver Island, opened the app and saw nothing.

Diagnose — not a bug, a boundary

BusPulse Vancouver rides TransLink, which is Metro Vancouver only. The nearest TransLink stop to Ucluelet is ~162 km away; the Island is BC Transit territory.

~162 km to nearest stop

8,731 stops audited

Fix the misleading empty state

Instead of “no stops within 500 m,” the app now checks the nearest stop and, past a 10 km threshold, says you’re outside the coverage area — in English and Punjabi.

`COVERAGE_MAX_M``nearestStopDistance()``outOfCoverage`

Commit & push

The honest coverage message ships in code — waiting for the next binary to carry it to users.

`62cd5ab`

03 Live listing fix

metadata · no build

Spotted: a “duplicate” in the description

The App Store page seemed to repeat itself near the top.

Diagnose — two fields, one sentence

The Promotional Text echoed the description’s opening line almost verbatim, so they stacked back-to-back on the product page.

Rewrite the promo, verify live

Replaced with a coverage-forward line. Promotional Text is editable with no new build or review — confirmed persisted after reload.

`live on 1.0``no build needed`

04 Build & submit

the reroute

Submit build 23 — expired

The attempt failed: EAS build artifacts expire after 30 days, and build 23 was a month old. It couldn’t be submitted — a rebuild was forced.

`artifact expired``EAS 30-day limit`

Pre-build audit + validation loop

Before spending a credit: type check, a full iOS export, i18n re-check, and a config sweep — env vars, keyless-proxy wiring, bundle ID, versioning. All clean.

`tsc clean``export ok``env ✓`

Build 24 + auto-submit

One credit produced v1.1.0 / build 24 — carrying *both* the Punjabi feature and the coverage fix — and pushed it straight to App Store Connect.

`v1.1.0 · build 24``--auto-submit`

Assemble the 1.1 version in ASC

Created the version, attached build 24, added a COVERAGE paragraph to the description and a warm "What's New," carried the screenshots over.

coverage paragraph

what's new

Submit for review — terminus

Release set to automatic on approval, all users, rating kept. Status flipped to **Waiting for Review**.

Waiting for Review

05 Closeout

housekeeping

Sync & push the docs

The App Store listing copy (new promo, coverage paragraph, 1.1 notes) committed and pushed so the repo matches what's live.

f83a069

pushed

Repo audit — public, but clean

The GitHub repo is public. Verified no secrets are exposed: the API key stays in a git-ignored file and the keyless-proxy build keeps it server-side. Flagged that making it private on a free plan would take the Pages-hosted privacy/support URLs offline.

no secrets

Pages caveat noted

HOW IT'S WIRED

Why the API key isn't in the app

The one piece of the build worth a picture: 1.1 ships without the TransLink key embedded. The phone talks to a caching proxy that holds the key server-side, so nothing sensitive rides in the binary or in the public repo.

The key lives only on the proxy. Remove the proxy and the app talks to TransLink directly with a key you'd have to embed — which is exactly what 1.1 avoids.

WHERE IT LIVES NOW

State of play

App Store · 1.0	Live. Promo-text duplicate already fixed in place.	LIVE
App Store · 1.1	Build 24 submitted; auto-releases on approval.	IN REVIEW
GitHub · master	Public, no secrets. HEAD at f83a069.	SYNCED
Punjabi feature	165/165, validated; in build 24.	SHIPPED
Coverage message	Fixed in code; reaches users with 1.1.	IN BUILD 24

FROM HERE

What's left, and what to watch

When review clears

- Apple emails a decision — usually 24–48 h.
- On approval, 1.1 auto-releases to everyone.
- Nothing to click; the release is automatic.

Watch-outs

- Don't make the repo private on a free plan — it kills the Pages privacy/support URLs Apple requires.
- Builds expire in 30 days — don't let the next one sit unsubmitted.

- Do a one-time visual check of Punjabi tab labels in Expo Go.
